NANCIS

WHEN ONLY THE VERY EARLIEST WILL DO

Cob Ripeness

Highest grain maturity of any variety tested. Proven year after year on farm to finish and reach full maturity quickly.

Maturity Group

Exceptionally early because of highest grain maturity and natural plant die down.

Quality & Digestibility

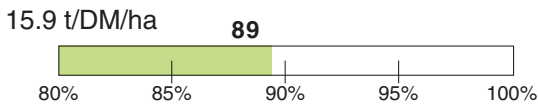

Ensure high starch, high dry matter silage is clamped without compromising on earliness. Above average cell wall digestibility.

Plant Description

Tall conventional variety with medium green erect leaves. Plant dies down naturally rather than from disease ensuring high dry matter content from natural maturity.

Yield

Sow at 45,000 seeds per acre | 111,000 seeds per hectare
High yields of dry matter, when grown in more marginal areas, whilst still being the first variety in the clamp.
